

Horse

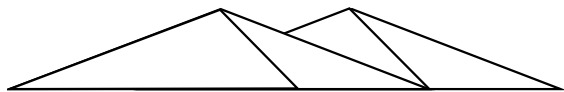

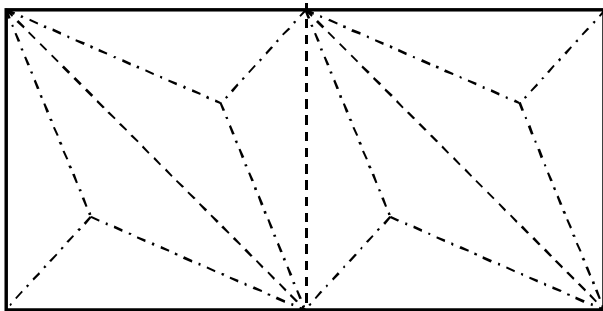

Developed in Feb 2004 by Ching-Yu Hung.

The base, I call the Alligator Base, was developed while I was attempting to make an alligator. Since then, I made this and a brontosaurus with the base, but as of May 2004, I'm still not happy how my alligator looks. Maybe someday there will be an alligator based on the Alligator Base.

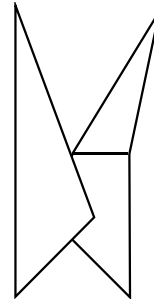

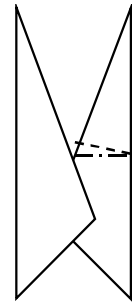

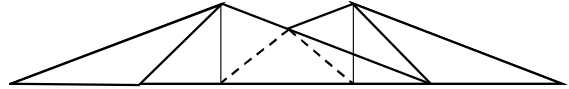

Start with a 1:2 ratio rectangular paper with the same color on both sides.

1
Fold along the following mountain/valley fold lines.

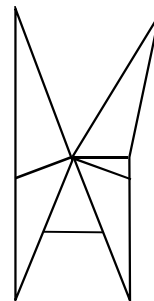

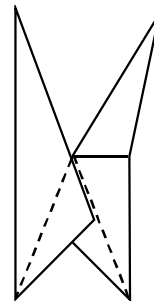

Here's the Alligator Base. Observe how it produces 4 small points for the limbs, 2 long points for the head/tail, and has a long body. The design is asymmetrical, though.

2
Flip the four small flaps away from the middle. Make the valley folds and stand up the two ends. One end will become the head and the other will become the tail. Pick one for the head, and do the in-out folds to bend down the head slightly.

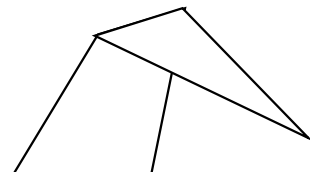

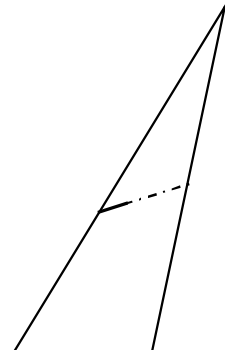

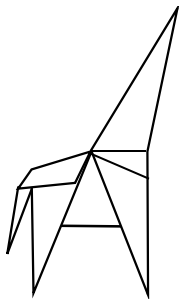

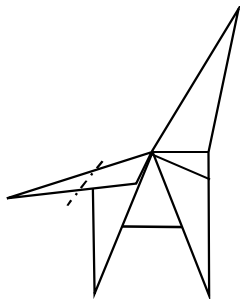

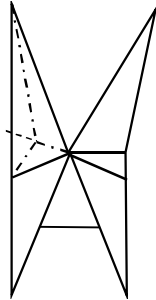

3
Fold thin the 4 legs.

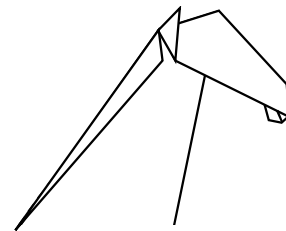

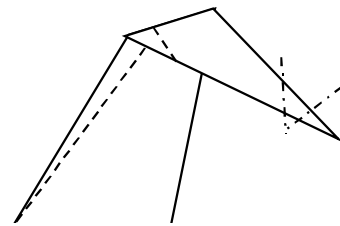

4

Pinch the tail sharp and then fold down the tail flap to cover the hips of the horse. Then, fold down the tail.

6

Do 2 inside reverse folds to form the nose. Fold up the ears. Fold down the mane, pinch the 4 legs sharp, and you're done.

5

Use scissors to make a small cut across both layers of the neck to form the 2 ears. Then, do an inside reverse fold along the cut lines to form the head.
